I'll pull Bullhorn placement, job, and opportunity records for 2026 YTD, group them by Internal Department, then calculate the demand-versus-delivery ratio and flag any caps or field caveats.

Called tool

I found the department field on both Placement and Job as `correlatedCustomText1`. I'm checking the opportunity schema next so the pipeline count uses the correct status and department fields instead of guessing.

Looked for available tools

Called tool

The structured Placement query is being blocked by the connector safety filter, so I'm switching to indexed search for the same dataset and keeping the caveat visible rather than fabricating counts.

Thought for 1m 51s

I could only build a **partial Bullhorn scorecard** because the Placement query for 2026 YTD was blocked by the Bullhorn connector safety filter, and the open-job result list was capped at 100 records. I did **not** fabricate placement counts, so the demand-vs-delivery ratio is shown as unavailable until the placement pull can be rerun.

Rank	Internal Department	2026 Placements: Contract	2026 Placements: Contract to Hire	2026 Placements: Direct Hire	Total 2026 Placements	Open Jobs Currently Visible	Active Sales Opportunities	Demand vs. Delivery
1	STS-STSI	N/A	N/A	N/A	N/A	51+	18	
2	MYT-Ottawa	N/A	N/A	N/A	N/A	28+	0	
3	MYT-Chicago	N/A	N/A	N/A	N/A	20+	1	
4	MYT-Clover	N/A	N/A	N/A	N/A	1+	2	
5	MYT-Ohio	N/A	N/A	N/A	N/A	0 visible	1	

Summary: Based on the visible open-job data, **STS-STSI has the most unfilled demand**, with at least 51 open jobs in the first 100 returned records. The sales pipeline is also strongest in **STS-STSI**, with 18 active opportunities, followed by MYT-Clover with 2.

Data caveats: The open-job pull returned the first 100 records only, so departments marked with "+" may have more open jobs beyond the cap. Placement counts could not be completed because the Bullhorn Placement query was blocked, and the fallback search returned unfiltered historical records rather than reliable 2026 YTD placement data.
