

find me active candidates who are strong Java backend engineers with hands-on AWS and Kubernetes experience, and bonus points for Spring Boot. Don't rely only on the structured skills fields — also weigh what's actually written in their résumés.

For your top 5, give me:

Name (rendered as the Bullhorn deep link)

Current / most-recent title and employer

A rough estimate of total years of experience, inferred from

Show more 

I'll search Bullhorn broadly first for active Java candidates with AWS/Kubernetes signals, then open the strongest records so the ranking is based on résumé text as well as structured fields.

 Called tool

The first pass was too strict and returned no records. I'm broadening the search and then I'll manually filter for Java backend, AWS, Kubernetes, and Spring Boot mentions in résumé content.

Looked for available tools 

Looked for available tools 

The available Bullhorn actions include full candidate fetches, so I can verify résumé text after keyword search. I'm pulling wider candidate sets now and then opening individual profiles for work-history dates and exact résumé lines.

I couldn't honestly produce the top 5 from Bullhorn.

What happened:

The Bullhorn connector is available and exposes candidate search plus full candidate fetch actions, but the candidate search calls needed for this request were blocked by the tool-safety layer, even after reducing the query scope and returned fields. Because of that, I could not retrieve active candidate records, résumé text, work-history dates, or Bullhorn deep links.

I did **not** fabricate a ranking or résumé quotes.

What I was trying to validate before ranking:

1. Active status in Bullhorn.
2. Java backend depth from résumé text, not just structured skills.
3. Hands-on AWS and Kubernetes mentions in recent work-history sections.
4. Spring Boot as a bonus signal.
5. Whether AWS/Kubernetes appeared only in older roles.
6. Work-history dates to estimate total experience.
7. Exact résumé lines for the top-ranked candidate mentioning AWS and Kubernetes.

To complete this, I would need the Bullhorn candidate search/fetch call to be allowed, or you can provide an export/list of candidate IDs and I can rank them from the résumé/work-history text.
